# States of a Java thread

① States of a Java thread

② Managing Threads

③ Daemon Thread and User Thread

④ Lifecycle of a thread

- New
  - Thread that has not yet started

- Runnable
  - Thread executing in the JVM

- Blocked
  - The thread is blocked waiting for a monitor lock

- Waiting
  - Waiting indefinitely for another thread to perform a particular action

- Timed\_Waiting
  - Thread is waiting for another thread to perform a particular action for up to a specified time

- Terminated
  - The thread has terminated

# Managing Threads

① States of a Java thread

② Managing Threads

- Set and Get names of Threads
- Checking whether threads have started
- Wait for threads to finish

③ Daemon Thread and User Thread

④ Lifecycle of a thread

## Set and Get names of Threads

### ② Managing Threads

- Set and Get names of Threads
  - Checking whether threads have started
  - Wait for threads to finish
- 
- Use constructions to define names of our threads
    - `public Thread(String name)`
    - `public Thread(Runnable target, String name)`
  - Normally, we set threads' names before they execute, but it is allowed to change afterwards:
    - `setName(String name)`
  - `getName()` returns the name of a thread as a string

## Checking whether threads have started

### ② Managing Threads

- Set and Get names of Threads
  - Checking whether threads have started
  - Wait for threads to finish
- 
- We can use `isAlive()` to check whether a thread has been started

```
1 public class ThreadExample extends Thread {  
2     public void run() {  
3         System.out.println("Thread is running...");  
4     }  
5  
6     public static void main(String[] args) {  
7         ThreadExample t1 = new ThreadExample();  
8         System.out.println("Thread started: " + t1.isAlive());  
9         t1.start();  
10        System.out.println("Thread started: " + t1.isAlive());  
11    }  
12}
```

## Wait for threads to finish

### ② Managing Threads

- Set and Get names of Threads
  - Checking whether threads have started
  - Wait for threads to finish
- 
- We can use `join()` to wait for a certain thread to finish before continuing

```
1  public class ThreadExample extends Thread {  
2      public void run() {  
3          for (int i = 0; i < 5; i++) {  
4              System.out.println(i);  
5              try {  
6                  Thread.sleep(500);  
7              } catch (InterruptedException e) {  
8                  System.out.println(e);  
9              }  
10         }  
11     }  
12  
13     public static void main(String[] args) {  
14         ThreadExample t1 = new ThreadExample();  
15         t1.start();  
16         try {  
17             t1.join();  
18         } catch (InterruptedException e) {  
19             System.out.println(e);  
20         }  
21         System.out.println("Thread has finished executing.");  
22     }  
23 }
```

# Daemon Thread and User Thread

1 States of a Java thread

2 Managing Threads

3 Daemon Thread and User Thread

4 Lifecycle of a thread

- Java offers two types of threads: user threads and daemon threads
- User threads are **high-priority**
  - JVM will wait for any user thread to complete its task before terminating it
- Daemon threads are
  - **Low Priority**
  - Only role is to **provide services to user threads**
  - Will not prevent the JVM from exiting (JVM quits only when all User threads have finished)
  - New threads created inside a Daemon thread are also daemon threads
- We use the `setDaemon(boolean on)` to set a thread to a Daemon thread

```
1 public class DaemonThreadExample implements Runnable {
2     public void run() {
3         if (Thread.currentThread().isDaemon()) {
4             System.out.println("Daemon thread is running...");
5         } else {
6             System.out.println("User thread is running...");
7         }
8     }
9
10    public static void main(String[] args) {
11        DaemonThreadExample runnable = new DaemonThreadExample();
12
13        Thread userThread = new Thread(runnable);
14        Thread daemonThread = new Thread(runnable);
15        daemonThread.setDaemon(true);
16
17        userThread.start();
18        daemonThread.start();
19    }
20}
```

## Lifecycle of a thread

- ① States of a Java thread
- ② Managing Threads
- ③ Daemon Thread and User Thread
- ④ Lifecycle of a thread
  - Stopping A Thread

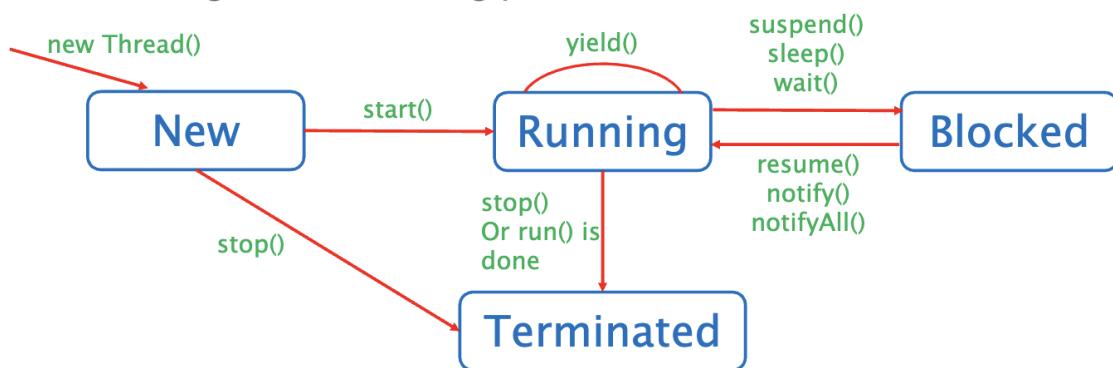

Figure: Life Cycle of a Thread

- **New**
  - Thread that has not yet started
  - Created using `new Thread()`
- **Runnable**
  - Thread executing in the JVM
  - Transitioned using `start()`
- **Blocked**
  - The thread is blocked waiting for a monitor lock
  - Can occur due to `suspend()`, `sleep()`, or `wait()`
- **Waiting**
  - Waiting indefinitely for another thread to perform a particular action
  - Can be resumed using `resume()`, `notify()`, or `notifyAll()`
- **Timed\_Waiting**
  - Thread is waiting for another thread to perform a particular action for up to a specified time
  - Can be resumed using `yield()`
- **Terminated**
  - The thread has terminated
  - Can occur due to `stop()` or when `run()` is done

# Stopping A Thread

## ④ Lifecycle of a thread

### • Stopping A Thread

- Using `stop()`, `suspend()` and `stop()` is deprecated
- Instead, use a "should run" boolean and a while loop in each thread like below:

```
1  public class StopThread implements Runnable {
2      private boolean flag = true;
3
4      public void run() {
5          int i = 0;
6          while (this.flag) {
7              System.out.println(Thread.currentThread().getName() + " is executing: i = " + (i++));
8          }
9      }
10
11     public void stop() {
12         this.flag = false;
13     }
14
15     public static void main(String[] args) {
16         StopThread mt = new StopThread();
17         Thread t = new Thread(mt);
18         t.start();
19
20         try {
21             Thread.sleep(500);
22         } catch (InterruptedException e) {
23             e.printStackTrace();
24         }
25
26         mt.stop();
27         System.out.println("Thread has been stopped.");
28     }
29 }
```
